

ABIDS Demonstration -- Executive Report

How Behavioral Intelligence Explains Recruiting Outcomes

Aaryatech Behavioral Joining Intelligence -- ABIDS Demonstration Run

This analysis uses a purpose-built DEMONSTRATION DATASET created to prove the ABIDS method end to end. It is not V Dart's or any client's real historical data.

The Business Problem

Staffing and recruitment companies lose candidates after they've already accepted an offer -- and traditional recruiting metrics (joining rate, time-to-fill) tell you THAT it happened, not WHY.

The Recruitment Problem

Recruiters have intuitions about why candidates disengage, but no structured, evidence-based way to test those intuitions, share them across a team, or measure whether addressing them actually helps.

Data Used

This demonstration used a purpose-built synthetic dataset of 2500 candidate applications and 17351 recruiter/candidate communications, engineered to resemble a real U.S. staffing operation without being one.

How ABIDS Works

Aaryatech's Behavioral Joining Intelligence Delivery System (ABIDS) follows a disciplined chain: candidate communications become behavioral evidence, evidence is mapped to a frozen, science-backed library of 34 behavioral mechanisms, mechanisms become recognizable scenarios, scenarios connect to real outcomes, and only then does a formal, testable hypothesis get proposed and statistically checked.

Behavioral Evidence

6749 pieces of behavioral evidence were extracted from candidate/recruiter communications -- specific, traceable observations, never guesses about what a candidate was thinking.

Human Review

275 evidence items were personally reviewed by a human analyst as a calibration sample before the method was applied more broadly. Every downstream record still shows whether it came from that human review or from the calibrated model applied afterward.

Behavioral Patterns

5749 scenarios emerged, concentrated around 14 distinct behavioral mechanisms -- most commonly Friction, Uncertainty / Ambiguity Aversion, Status Quo Bias.

Candidate Scenarios

Each pattern was translated from abstract behavioral science into a concrete, recognizable recruiting situation a recruiter could actually notice in a live conversation.

Joining Outcomes

Patterns were connected to whether a candidate ultimately joined, using only the discovery and hypothesis-generation portions of the dataset -- a separate, sealed portion was deliberately held back for future validation and was not used anywhere in this analysis.

Hypotheses

14 formal, falsifiable hypotheses were proposed. 11 had enough evidence to actually test.

Statistical Evidence

5 of 11 tested hypotheses showed a real, measurable association between a behavioral pattern and joining outcomes -- graded honestly (SUPPORTED, WEAK, or INCONCLUSIVE), never inflated by a p-value alone.

Six ABIDS Intelligence Outputs

The findings above are organized into six connected reports -- Leakage Map, Priority Index, Uncertainty Matrix, Scenario Matrix, Journey Map, and Intervention Matrix -- each a different lens on the same underlying evidence, not six separate analyses.

Intervention Opportunities

For statistically supported patterns, this demonstration proposes specific recruiter questions and candidate-facing ideas to test -- never automated actions, always something a human recruiter chooses to try.

Measurement / Learning Loop

Every proposed intervention includes what would need to be measured to know if it worked. None have been piloted yet in this demonstration -- that is deliberately the next step, not this one.
