

Aaryatech™ Behavioral Leakage Map

Report 1 of 6 -- Demonstration Run

Aaryatech Behavioral Joining Intelligence -- ABIDS Demonstration Run

This analysis uses a purpose-built DEMONSTRATION DATASET created to prove the ABIDS method end to end. It is not VDart's or any client's real historical data.

Business Question

Which behavioral patterns show up around the points in our hiring process where candidates disengage or don't start?

What We Found

- 5749 concrete behavioral situations were identified across the candidate journey, drawn from 6749 pieces of candidate/recruiter communication evidence.
- The most frequently observed patterns are: Friction (1736 instances), Uncertainty / Ambiguity Aversion (985 instances), Status Quo Bias (940 instances), Goal Gradient (548 instances), Reciprocity (364 instances).
- These patterns are not spread evenly across the hiring journey -- some concentrate heavily around specific stages (see the Journey Map report for stage-by-stage detail).

What The Evidence Supports

- Where a hypothesis was formally tested (see the Hypothesis report), 5 of 11 tested patterns showed a statistically meaningful association with whether a candidate ultimately joined.
- These associations are descriptive of the demonstration dataset only -- they describe a pattern in the data, not a guaranteed cause of any individual candidate's decision.

What We Do Not Yet Know

- Whether these same patterns and concentrations would appear in a real client's actual candidate population.
- Whether the association survives held-out validation (not yet run) or replication on a second period of data.
- Whether specific job families, clients, or recruiter teams drive the pattern more than others (not yet stratified).

Why This Matters

Knowing WHERE behavioral patterns cluster around leakage lets a staffing team target investigation and process changes at the right moment, instead of guessing across the whole funnel.

What To Investigate / Test Next

- Review the Journey Map report to see which stage(s) carry the most concentrated evidence.
- Pull a small sample of real client communications from the same stage and see if similar patterns appear.
- Consider a recruiter coaching pilot focused on the single highest-volume pattern first.
